Referral Date / Time : 2022-06-13 12:55:48

Referring : LEW SOOK WEIH

Referral Reason : For further assessment and expert opinion

Chief complaint / problem : Fine motor and speech delay

Analysis : TRO Autistic spectrum disorder

History : Thank you for seeing this 3 years 7 months old girl who has been under our follow up for fine motor and speech delay and has been undergoing regular occupational and speech therapy.

She was born full term at Hospital Kuala Lipis with a birth weight of 3.23kg. Mum had no problems antenatally. She is the youngest of 3 siblings. There is no history of speech delay or learning disability or autism in family.

She initially presented at 2 years 9 months old with
a) speech development at 15- 18 months old with single word vocabulary and being able to carry out simple commands
b) fine motor development at 18 - 24 months with ability to scribble to and fro but no vertical lines and able to build tower of 5.
c) social development at 24 - 30 months and gross motor development was appropriate to age.

Since then her speech has improved to two - three word sentences and her eye contact has improved. When questioning the parents, the DSM 5 criteria is not fulfilled as parents feel that the child is able to play with other children and there are no restrictive or repetitive behaviour noted.

However, during the consultation, the child is noted to have ill sustained eye contact and showed certain autistic characteristics. She was assessed by the clinical psychologist assessment using Vineland and Gillian score with an impression of ASD level 2. Due to conflicting opinions of the parents on interviewing using DSM 5 criteria and the clinical psychologist report, I am referring to you for your expert opinion.
Thanking you in advance.

Kind regards
Dr Lew Sook Weih
