

Original issue: Dec. 10/2001 Update No. 49: June 15/2023

64511 BORDES CEDEX - FRANCE - Tel.: +33 (0)5 59 12 50 00 www.safran-helicopter-engines.com

LETTER This covering letter is not part of the MAINTENANCE MANUAL. Do not keep it on the MAINTENANCE MANUAL.

Bordes, Jun. 15/2023

Dear Sir / Madam,

The ARRIEL 2 C2 MAINTENANCE MANUAL No. X 292 N6 450 2 has been subject to normal update No. 49 on Jun. 15/2023.

A description of the update (description, pages to be removed or inserted) is provided below.

We remain at your disposal for any further information you may require. Very truly yours

Technical Publications

TROUBLESHOOTING - INTRODUCTION

1. <u>GENERAL</u>

This document contains some data extracted from the ARRIEL Maintenance Manual, chapter 71-00-06 - Trouble shooting.

It is devoted to the engine maintenance personnel for finding possible failures.

For Legibility purpose, this manual is divided up into 6 sections:

- Section 1: List of effective pages, contents
- Section 2: introduction, this section gives the manual Lay-out and the general
- Section 3: list of failures observed during use
- Section 4: List of failures observed during maintenance
- Section 5: List of VEMD failure messages
- Section 6: maintenance tasks from the above lists.

These non exhaustive Lists and trouble shootings are drawn up and completed as experience is gained on the engine.

2. INTRODUCTION

A. Description

Refer to Figure 001

There are two main indicating devices in the cockpit: the CPDS (Central Panel Display System) and the warning panel.

The CPDS includes the VEMD (Vehicle and Engine Multifunction Display) and CAD (Caution and Advisories Display).

The VEMD displays all the necessary vehicle and engine parameters. It can also display maintenance information when the aircraft is on the ground. It has an upper and lower screen for selecting the various functions.

The CAD records and displays the cautions and advisories to the pilot relating to the main systems of the engine and the aircraft. It is used as the VEMD back-up when failures occur on screens or modules. It has a screen with pushbuttons enabling selection of the different functions.

The Central Warning Panel has a set of warning lights to alert the pilot in case of operation anomaly.

Engine indication in the cockpit - Description

B. CPDS

The CPDS has 3 operating modes:

- The operational mode ("FLIGHT" mode)
- The maintenance mode ("MAINT" mode)
- The configuration mode ("CONFIG" mode).
- (1) Operational mode ("FLIGHT" mode)

This mode has several screen pages:

- The initial configuration that the pilot can use in flight to check the aircraft performance (FLI/ELEC/VEH on the VEMD and CAU/FUEL on the CAD).
- The pages accessible on the VEMD lower screen pressing the "SCROLL" key (EPC, PERFO and SYSTEM STATUS).
- The automatic reconfiguration at the end of the flight on the VEMD lower screen (FLIGHT REPORT page).
- A page on the CAD when both VEMD screens are not available (CAU/DELTA N1 page).

In these pages, the displays are as follows:

- (a) Initial configuration Refer to Figure 002
 - <u>1</u> Upper screen (FLI page):

High information zone for each engine:

- Bleed valve flag
- P2 (sand filter)
- Engine normal limitations: MPC (PMC) MTOP (PMD)
- OEI indications (LO, HI)
- Training mode indication.

FLI zone, for each engine:

- Numeric torque
- Numeric T4.5
- Numeric N1.

FLI means First Limit Indication, it is a graduated analog indicator.

The indicator needle is positioned as a function of the parameter which is nearest to its limits.

The parameters used are N1, T4.5 and Torque.

When the needle reaches the MTOP (PMD) indication, one of the paramaters has reached its take-off limit. There is a numeric indication of each parameter for each engine and on both sides of the FLI indicator.

When a parameter approaches its limits, a yellow line flashes under the numerical display; when it reaches the limit, the line becomes red and an aural alarm sounds.

Low information zone for each engine:

- Start indication
- Display of "FLI DEGR" and "FLI FAIL" messages corresponding to a sensor loss or FLI loss.

Message zone: Display of some messages devoted to the crew members (one message at a time on one line).

- <u>NOTE</u>: Safran Helicopter Engines uses the terminology defined in the ARP 755a document, such as T4.5 and P3, nevertheless ECF uses TOT and P2 for this same value.
- <u>NOTE</u>: FLI (First Limit Indication) can be replaced in french with IPL (Indicateur de Première Limite).

WEMD

CAD

Operational mode - Operation

ARRIEL 2 C2

- <u>2</u> Lower screen (ELEC/VEH page):
 - Numeric OAT
 - Numeric main bus voltage
 - Numeric starter current
 - Numeric MGB oil temperature and bargraph animation
 - pMGB oil pressure and bargraph animation
 - VNE (Never exceeded Speed)
 - Sling load.

For each engine:

- Numeric engine oil temperature and bargraph animation
- Numeric engine oil pressure and bargraph animation
- Numeric hydraulic pressure and bargraph animation.
- 3 CAD screen (CAU/FUEL page):
 - Remaining numeric flight time
 - Numeric fuel quantity and bargraph.

For each engine:

- Cautions and advisories
- Numeric fuel flow
- Numeric engine fuel pressure and bargraph animation.
- (b) Pages accessible on the VEMD bargraph pressing the "SCROLL" key Refer to Figure 003
 - <u>1</u> EPC page (Engine Power Check)

The Engine Power Check is activated automatically when the pilot depresses the "SCROLL" key. The results are displayed on another page and recorded to be accessible in the maintenance mode.

<u>2</u> PERFO page (Performance)

This page shows the performance accessible as a function of the weight breakdown.

3 SYSTEM STATUS page

This is an alphanumeric page which includes the information transmitted by the EECU of each engine:

- A "MESS" line which corresponds to the state word
- A "FAIL" line which corresponds to the failure word
- The numeric values, names and measuring units of 9 parameters.

To select and move from one line to the other, use the "SELECT" key. A white frame surrounds the selected line. "+/-" keys are used to make the different messages of each line scroll.

Troubleshooting - Introduction Page 6 Dec. 30/2021

ARRIEL 2 C2

Operational mode - Operation

- (c) Automatic reconfiguration at the end of the flight on the lower screen of the VEMD Refer to Figure 004
 - <u>1</u> FLIGHT REPORT page

The Flight Report is automatically displayed at the end of the flight. It supplies the information below:

- The flight number
- The flight time
- N1 and N2 cycles, those of the flight and all cycles
- Over Limit flag in case of exceedance
- Failure flag (failure) in case of failure.

This page is memorized and is only accessible in the maintenance mode.

Operational mode - Operation

ARRIEL 2 C2

- (d) When both VEMD screens are not available Refer to Figure 005
 - <u>1</u> CAD screen (CAU/DELTA N1 page)
 - Cautions and advisories.
 - For each engine: Analog delta N1

Operational mode - Operation

ARRIEL 2 C2

(2) Maintenance mode ("MAINT" mode) Refer to Figure 006

This mode can only be activated when the engine is detected in the "shutdown" state and the VEMD is set to OFF.

To get access to the maintenance pages, depress the "SCROLL" and "RESET" keys simultaneously, keeping them depressed, turn on the VEMD using the OFF 1 and OFF 2 keys.

On the Maintenance Menu page, use the "SELECT" key to select the line and the "ENTER" key to go to the selected line.

In the maintenance mode, the pages below are displayed: Refer to Figure 007

- FLIGHT REPORT,
- FAILURE,
- OVER LIMIT,
- ENGINE POWER CHECK,
- TRANS. DATA,
- FUNCT. TIMES.

FLIGHT REPORT: this page is automatically displayed at the end of the flight on the lower screen and is identical to the operational mode ("FLIGHT" mode).

(a) Flight Report

This page displays the last 16 recorded flights.

(b) Failure

The failures are displayed on four pages:

- Failure Diagnosis
- Subsystem Sélection
- Complet Diagnosis
- Parameters (6 pages).

"+/-" keys are used to select the flights from the Failure Diagnosis page or the failures from the Complete Diagnosis page. The "SELECT" key is used to select the VEMD or CAD sub-system from the Subsystem Selection page. The "ENTER" key is used to move from one page to another.

(c) Over Limit

This page displays the limits exceedance recorded during the last flights.

(d) Engine Power Check

The last 8 results of the Power Check are displayed.

(e) Trans. Data

This function is used to transfer the information between both modules of the VEMD.

(f) Func. Times

This page displays the total operating hours of the VEMD and of the engine.

Maintenance mode - Description

Maintenance mode - Menus

Troubleshooting - Introduction Page 14 Dec. 30/2021

C. Warning light table

Three central warning panel lights indicate an engine operating anomaly. The engine indicating system supplies such information Refer to Figure 008

Indicator light	Designation	Color	Definition	Data from
1	ENG 1 et ENG 2	Red	Min. engine oil pressure	Engine sensor
2	GOV 1 et GOV 2	Red	Major failure or engine power anomaly	EECU
3	Diff. N1	Red	N1 deviation	"Power loss" board

<u>NOTE</u>: The minor failure is indicated by an amber GOV warning light when N1 < 20 %.

The redundancy failure is indicated by the flashing of the amber GOV warning light when N1 < 20 %.

Warning Lights of the Central Warning Panel

Figure 008

The information in this manual is subject to the warning given on the information page.

Troubleshooting - Introduction Page 16 Dec. 30/2021

3. FAILURES OBSERVED DURING USE

The 3rd section of this manual gives the failures observed during use.

These are the failures detected by the flight crew. These failures either correspond to a flight incident without indication to the cockpit (surge for example), or an indication to the CPDS or to the showing an exceedance of the flight parameters (exceedance of N2 limitations for example) or an anomaly indicated by the control systems (lighting up of the magnetic plug warning light for example).

The contents are divided up as follows:

- 1. Operation phase: power up, start, operation, shutdown.
- 2. Identification of the helicopter indication means: CDS, engine indicating instruments (see general).
- 3. Failure designation.

4. Task number of the trouble shooting procedure corresponding to the last section of the manual. Example :

A. At power up (a)

INDICATION (b)		DESCRIPTION (c)	TASK No.(d)
VEMD	Warning lights		
	Fuel tank	Pre-blockage signal of the fuel filtering ele- ment	71-00-06-811-801

4. FAILURES OBSERVED DURING MAINTENANCE

The 4th section of this manual gives the failures observed during maintenance.

The maintenance personnel detects them after periodic inspection or after a test procedure. The contents includes:

1. Failure designation

Task number of the related trouble shooting procedure in the last section of the manual. Example:

DESIGNATION (a)	TASK No.(b)
Exhaust fumes	71-00-06-816-801

5. VEMD FAILURE CODES

The 5th section of this manual gives the VEMD failure messages pertaining to the engine. The VEMD has a maintenance aid to help with trouble shooting. The VEMD displays the failures indicated by the EECU.

A. Failures indicated by the EECU: Operational mode, System Status page

Refer to Figure 009

ARRIEL 2 C2

The failures are displayed in flight when they are detected. During engine shutdown, there is no recording.

The failures detected by the EECU are transmitted to the VEMD which displays them on the System Status page, "FAIL" line. These are simple failure messages.

This display is alphanumeric.

Example of failure word:

- W/DOG.A,
- ALTER.B.

To this indication is linked the lighting up of a GOV warning light which shows the effect of the failure on the EECU operation.

If a failure affects the main control law, the system uses the back-up law.

The main functions (N1 and N2 regulation, acceleration and deceleration control) are still ensured.

If a failure affects at the same time the main control law and the back-up law, the system changes the channel automatically.

If one or several failures affect the main regulation law and the back-up law of each channel, the system can no longer regulate and automatically freezes the stepper motor.

For each input signal, the EECU uses the criteria to make a decision on the validity signal.

Operational mode - In flight

MAINTENANCE MANUAL

ARRIEL 2 C2

Three levels are indicated: Refer to Figure 010

- Level 3: Major failure (stepper motor frozen)
- Level 2: Minor failure (the system operation is degraded but the main functions are still ensured)
- Level 1: Minor anomaly (loss of redundancy or of a related function and no effect on the engine operation).

Two warning lights indicate the failures: Red GOV and Amber GOV

- A red GOV light indicates the total failure of the regulation system
- An amber GOV light indicates the degraded operation of the regulation system. If this light flashes at starting, idle or shutdown, it also indicates a minor failure.

<u>NOTE</u>: The letter at the end of a failure word (A or B) corresponds to channel A or channel B of the EECU.

The architecture of the EECU is of the double channel type. The system includes two channels (channel A and channel B).

Each channel monitors all the data resources to which it gets access and provides information on its ability to ensure engine control.

According to the information supplied by both channels, the selection logic gives the control to the preferential channel if both channels are able to regulate the engine, gives the control to the channel able to regulate if only one channel is able to regulate, freezes the fuel flow if both channels cannot regulate;

During normal operation, channel A is the preferential channel, i.e. in control. Channel B is the pending channel.

For the VEMD failure messages, the trouble shooting processing is based on an operation with the preferential channel A.
ARRIEL 2 C2

Tolerance and failure indication

Troubleshooting - Introduction

71-00-06 Dec. 30/2021

Page 22

B. Contents of the failure messages in the operational mode, Status System page

<u>CAUTION</u>: FOR THE VEMD FAILURE MESSAGES, THE PROCESSING OF THE TROUBLE SHOOTING IS BASED ON AN OPERATION WITH THE PREFERENTIAL CHANNEL A.

The contents includes:

- 1. The identification of the helicopter indication means: VEMD failure word and related GOV warning light.
- 2. The failure designation.
- 3. The task number of the related trouble shooting procedure in the last section of the manual.

INDICA	TION (a)	DESIGNATION (b)	TASK No. (c)
VEMD codes	GOV warning light		
W/DOG. A	Flashing amber	Watchdog trip	71-00-06-817-801

6. TROUBLE SHOOTING

The 6th section of this manual gives, in the form of trouble shooting, the tasks from the contents.

The descriptive part of the trouble shooting procedure is function of:

- The helicopter indication means: CWP, CPDS
- The operation phase, power up, starting, operation, shutdown for the failures observed during use
- The reference to the check, inspection or test tasks for the failures observed during maintenance
- The failure effects on the engine use for VEMD failure messages
- A reminder of the normal operating condition
- The components list.

The failure handling, in the form of a tree, is done by comparing the reliability data, accessibility criteria and complexity of check or test tasks of the applicable components.

<u>NOTE</u>: The trouble shooting given in this manual only concern the engine part of the applicable systems.

- <u>NOTE</u>: Before you start the trouble shooting, make sure that all the ckecks and instructions have been applied.
- <u>NOTE</u>: Before you start the trouble shooting, make sure that all the procedures described in the flight manual are correctly applied.
- <u>NOTE</u>: Before you start the trouble shooting, make sure that the warning light or indicator is serviceable before you make a decision on the failure of the related system.

7. TASK NUMBERING

The standardized numbering of the task is an extension of the three-digit A.T.A. system. In this chapter, the numbering system has 5 groups of characters. Example:

ARRIEL 2 C2

Task No.	71	00	06	811	801
Group	1	2	3	4	5

A. The group 1, 2, 3 gives the chapter, section, subject:

71 : turboshaft engine

00 : general

06 : subject order

B. The group 4 gives the type of maintenance function

The first two digit 81 are the code number of the maintenance program (trouble shooting).

The third digit in this group gives the engine operating phase when the failure is detected or its detection mode:

1: Power on

2 : Start

- 3 : Transient rating
- 4 : During operation
- 6 : Check and inspection
- 7 : Failure message

C. The group 5 gives, to each group 4, a serial number from 801

FAILURES FOUND DURING OPERATION

<u>CAUTION</u>: BEFORE THE REMOVAL OF THE ENGINE FROM THE AIRFRAME, (REFER TO TASK 71-02-16-280-801) "TREATMENT OF AN ENGINE/MODULE BEFORE RETURN TO A MAINTENANCE CENTER".

1. <u>LIST</u>

A. At power up

Indication			
Alarms VEMD	Warning indicator lights	Failure indentification	Task No.
	Fuel tank	Pre-blockage signal of the fuel filtering element	71-00-06-811-801
	Fuel tank	No low fuel pressure signal	71-00-06-811-802
	Red ENG 1 or ENG 2 off	No low oil pressure signal	71-00-06-811-803
	Red GOV Amber GOV Flashing amber GOV	Lighting up of the GOV warning light	71-00-06-811-804
	FADEC and GOV not lit	No illumination of FADEC and GOV lights during EECU self test	71-00-06-811-806
	FADEC FAIL message	FADEC FAIL AT POWER UP	71-00-06-811-808

B. At starting

Indication			
Alarms VEMD	Warning indicator lights	Failure indentification	Task No.
	Fuel tank	No extinguishing of the low fuel pressure signal	71-00-06-812-802
Red flash under TOT and Over Limit detected		T4.5 overtemperature	71-00-06-812-804
		Gas generator not driven	71-00-06-812-805
	Red ENG 1 or ENG 2 on	No extinguishing of the low oil pressure signal	71-00-06-812-806
		Aborted start - No ignition	71-00-06-812-807
		Aborted start - Flame out	71-00-06-812-810
		Aborted start - Flames at the exhaust pipe	71-00-06-812-812

List of failures observed during engine operation

ARRIEL 2 C2

Indication			
Alarms VEMD	Warning indicator lights	Failure indentification	Task No.
		No oil pressure rise at starting	71-00-06-812-813
		Helicopter rotor movement that occurs after the usual time during engine start	71-00-06-812-816

C. Engine running

Indic	ation		
Alarms VEMD	Warning indicator lights	Failure indentification	Task No.
		Surge	71-00-06-813-801
	ENG CHIP on	Indicator light of the electrical magnetic plug on	71-00-06-814-801
	Fuel tank	Pre-blockage signal of the fuel filtering element	71-00-06-814-802
	Fuel tank	Low fuel pressure signal	71-00-06-814-803
Red flash under TRQ and Over Limit detected		Torque limitations exceeded	71-00-06-814-805
Red flash under N1 and Over Limit detected		N1 limitations exceeded	71-00-06-814-806
Over Limit detected	NR/2 NTL indicator	N2 limitations exceeded	71-00-06-814-807
ENGINE OIL PRESSURE indicator		Abnormal evolution of the oil pressure	71-00-06-814-808
	Red ENG 1 or ENG 2 on	Low oil pressure signal	71-00-06-814-809
Red line under ENGINE OIL TEMPERATURE		Oil overtemperature	71-00-06-814-810

D. Engine shutdown

Indication			
Alarms VEMD	Warning indicator lights	Failure indentification	Task No.
		Abnormal noise during the rundown phase	71-00-06-815-801
		Rundown time less than 25s	71-00-06-815-802
	Fuel tank	No low fuel pressure signal	71-00-06-815-804

Indication			
Alarms VEMD	Warning indicator lights	Failure indentification	Task No.
	Red ENG 1 or ENG 2 off	No low oil pressure signal	71-00-06-815-805
		Power turbine blocked	71-00-06-815-806

TASK 71-00-06-811-806-A01

NO ILLUMINATION OF FADEC AND GOV LIGHTS DURING EECU SELF TEST TROUBLESHOOTING

1. GENERAL

A. PHASE AND FAILURE DETECTION

	Indication	
Phase	Alarms on the VEMD	CAD MESSAGE
AT POWER UP		FADEC and GOV not lit

B. REMINDER OF THE NORMAL OPERATING CONDITION

At EECU Power ON, during the EECU self-test, the EECU powers the following warning lights: GOV, FADEC. At the end of the EECU self-test, the warning lights GOV and FADEC are extinguished.

C. POSSIBLE CAUSES

- EECU
- 28V supply to the EECU (Aircraft side)

2. PROCEDURE

<u>NOTE</u>: The EECU has three power supplies: one dedicated to channel A, one dedicated to channel B and one dedicated to EECU discrete outputs (which includes the GOV and FADEC lights).

The power supply interfaces at the EECU are:

- Discrete outputs: connector P4 pins 2 (+) and 3 (-)
- Channel A: connector P2 pins 54 (+) and 55 (-)
- Channel B: connector P4 pins 63 (+) and 62 (-).

With battery power ON, +28 Vdc power supply should always be present at these interfaces.

TASK 71-00-06-812-805-A01

ABORTED START - GAS GENERATOR NOT DRIVEN TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

In the troubleshooting book, there are different troubleshooting tasks concerning aborted start. Titles are:

- "Aborted start: gas generator not driven": Do this troubleshooting task if the gas generator is not driven at all (N1 = 0 %) at the engine start selection or during cranking.
- "Aborted start: no ignition": When the pilot turns the main selector STOP/IDLE/FLIGHT to IDLE or FLIGHT, the EECU launches the starting sequence. At starting, the gas generator is driven but no ignition of the combustion chamber (T4 does not increase).
- "Aborted start: first start aborted": Do this preventive task when there are starting difficulties only at the first start of the day, or after the aircraft has been sitting for several hours, i.e. the engine is at ambient temperature.
- "Aborted start: slow start or stagnation": Do this troubleshooting task when the ignition in the combustion chamber is observed, but the N1 speed increases more slowly than usual, or the N1 speed stops increasing during start (and the pilot has to abort manually the starting sequence).
- **"Aborted start: flames at the exhaust pipe":** Do this troubleshooting task when the starting sequence generates abnormal flames at the exhaust pipe.
- "Aborted start: flame out": Do this troubleshooting task when ignition is observed, the N1 speed increases but the combustion chamber flames out without any action by the pilot.
- **"T4.5 limitations exceeded":** Do this troubleshooting task when a T4.5 overtemperature is observed during engine running or during starting sequence.

B. POSSIBLE CAUSES

- Starter generator
- Alternator
- Oil pump
- Fuel pump and metering unit
- Module 01 (Transmission shaft and accessory gearbox)
- Module 02 (Axial compressor)
- Module 03 (Gas generator)
- Aircraft

2. PROCEDURE

<u>NOTE</u>: In case of a recent maintenance operation performed on this engine or on the aircraft starting system (starter, battery, fuse, selector, harness...), check first the sub-assembly concerned by this maintenance operation, in particular the plug and connectors.

TASK 71-00-06-812-807-A01

ABORTED START - NO IGNITION TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

In the troubleshooting book, there are different troubleshooting tasks concerning aborted start. Titles are:

- "Aborted start: gas generator not driven": Do this troubleshooting task if the gas generator is not driven at all (N1 = 0 %) at the engine start selection or during cranking.
- "Aborted start: no ignition": When the pilot turns the main selector STOP/IDLE/FLIGHT to IDLE or FLIGHT, the EECU launches the starting sequence. At starting, the gas generator is driven but no ignition of the combustion chamber (T4 does not increase).
- "Aborted start: first start aborted": Do this preventive task when there are starting difficulties only at the first start of the day, or after the aircraft has been sitting for several hours, i.e. the engine is at ambient temperature.
- "Aborted start: slow start or stagnation": Do this troubleshooting task when the ignition in the combustion chamber is observed, but the N1 speed increases more slowly than usual, or the N1 speed stops increasing during start (and the pilot has to abort manually the starting sequence).
- "Aborted start: flames at the exhaust pipe": Do this troubleshooting task when the starting sequence generates abnormal flames at the exhaust pipe.
- "Aborted start: flame out": Do this troubleshooting task when ignition is observed, the N1 speed increases but the combustion chamber flames out without any action by the pilot.
- "T4.5 limitations exceeded": Do this troubleshooting task when a T4.5 overtemperature is observed during engine running or during starting sequence.

B. POSSIBLE CAUSES

- Igniters plugs
- Ignition unit
- Ignition cable
- Fuel valve assembly
- Start injectors
- Control and monitoring harness
- Pump and metering unit assembly
- Start air purge valve
- EECU
- Aircraft.

2. PROCEDURE

- <u>NOTE</u>: 1. In case of a recent maintenance operation performed on this engine or on the aircraft starting system (starter, battery, fuse, selector, harness...), check first the sub-assembly concerned by this maintenance operation, in particular the plug and connectors.
- <u>NOTE</u>: 2. It is possible to interchange an equipment item with another engine.

Effectivity: C2

71-00-06-812-807-A01

- If the engine starts normally, both equipment items should be reinstalled in their original location in order to confirm the anomaly. If the anomaly is confirmed, then the unserviceable equipment item has to be replaced.
- If the engine does not start normally, both the equipment items should be reinstalled in their original location and you should perform the next step of the troubleshooting tree.

TASK 71-00-06-812-808-A01

ABORTED START - SLOW START OR STAGNATION TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

In the troubleshooting book, there are different troubleshooting tasks concerning aborted start. Titles are:

- "Aborted start: gas generator not driven": Do this troubleshooting task if the gas generator is not driven at all (N1 = 0 %) at the engine start selection or during cranking.
- "Aborted start: no ignition": When the pilot turns the main selector STOP/IDLE/FLIGHT to IDLE or FLIGHT, the EECU launches the starting sequence. At starting, the gas generator is driven but no ignition of the combustion chamber (T4 does not increase).
- "Aborted start: first start aborted": Do this preventive task when there are starting difficulties only at the first start of the day, or after the aircraft has been sitting for several hours, i.e. the engine is at ambient temperature.
- "Aborted start: slow start or stagnation": Do this troubleshooting task when the ignition in the combustion chamber is observed, but the N1 speed increases more slowly than usual, or the N1 speed stops increasing during start (and the pilot has to abort manually the starting sequence).
- **"Aborted start: flames at the exhaust pipe":** Do this troubleshooting task when the starting sequence generates abnormal flames at the exhaust pipe.
- "Aborted start: flame out": Do this troubleshooting task when ignition is observed, the N1 speed increases but the combustion chamber flames out without any action by the pilot.
- "T4.5 limitations exceeded": Do this troubleshooting task when a T4.5 overtemperature is observed during engine running or during starting sequence.

B. POSSIBLE CAUSES

- Pyrometric harness
- Fuel valve assembly (Pressurizing valve not LRU)
- Start electro-valve
- Start air bleed valve
- Junction and T4.5 conformation box

2. PROCEDURE

- <u>NOTE</u>: 1. In case of a recent maintenance operation performed on this engine or on the aircraft starting system (starter, battery, fuse, selector, harness...), check first the sub-assembly concerned by this maintenance operation, in particular the plug and connectors.
- <u>NOTE</u>: 2. It is possible to interchange an equipment item with another engine.

ABORTED START - FLAME OUT TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

In the troubleshooting book, there are different troubleshooting tasks concerning aborted start. Titles are:

- "Aborted start: gas generator not driven": Do this troubleshooting task if the gas generator is not driven at all (N1 = 0 %) at the engine start selection or during cranking.
- "Aborted start: no ignition": When the pilot turns the main selector STOP/IDLE/FLIGHT to IDLE or FLIGHT, the EECU launches the starting sequence. At starting, the gas generator is driven but no ignition of the combustion chamber (T4 does not increase).
- "Aborted start: first start aborted": Do this preventive task when there are starting difficulties only at the first start of the day, or after the aircraft has been sitting for several hours, i.e. the engine is at ambient temperature.
- "Aborted start: slow start or stagnation": Do this troubleshooting task when the ignition in the combustion chamber is observed, but the N1 speed increases more slowly than usual, or the N1 speed stops increasing during start (and the pilot has to abort manually the starting sequence).
- **"Aborted start: flames at the exhaust pipe":** Do this troubleshooting task when the starting sequence generates abnormal flames at the exhaust pipe.
- "Aborted start: flame out": Do this troubleshooting task when ignition is observed, the N1 speed increases but the combustion chamber flames out without any action by the pilot.
- **"T4.5 limitations exceeded":** Do this troubleshooting task when a T4.5 overtemperature is observed during engine running or during starting sequence.

B. POSSIBLE CAUSES

- Fuel valve assembly

2. PROCEDURE

- <u>NOTE</u>: 1. In case of a recent maintenance operation performed on this engine or on the aircraft starting system (starter, battery, fuse, selector, harness...), check first the sub-assembly concerned by this maintenance operation, in particular the plug and connectors.
- NOTE: 2. It is possible to interchange an equipment item with another engine.
 - If the engine starts normally, both equipment items should be reinstalled in their original location in order to confirm the anomaly. If the anomaly is confirmed, then the unserviceable equipment item has to be replaced.
 - If the engine does not start normally, both the equipment items should be reinstalled in their original location and you should perform the next step of the troubleshooting tree.

TASK 71-00-06-812-811-A01

ABORTED START - FIRST START ABORTED TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

In the troubleshooting book, there are different troubleshooting tasks concerning aborted start. Titles are:

- <u>"Aborted start: gas generator not driven"</u>: Do this troubleshooting task if the gas generator is not driven at all (N1 = 0%) at the engine start selection or during cranking.
- <u>"Aborted start: no ignition"</u>: When the pilot turns the main selector STOP/IDLE/FLIGHT to IDLE or FLIGHT, the EECU launches the starting sequence. At starting, the gas generator is driven but no ignition of the combustion chamber (T4 does not increase).
- <u>"Aborted start: first start aborted"</u>: Do this preventive task when there are starting difficulties only at the first start of the day, or after the aircraft has been sitting for several hours, i.e. the engine is at ambient temperature.
- <u>"Aborted start: slow start or stagnation"</u>: Do this troubleshooting task when ignition in the combustion chamber is observed, but the N1 speed increases more slowly than usual, or the N1 speed stops increasing during start (and the pilot has to abort manually the starting sequence).
- <u>"Aborted start: flames at the exhaust pipe"</u>: Do this troubleshooting task when the starting sequence generates abnormal flames at the exhaust pipe.
- <u>"Aborted start: flame out"</u>: Do this troubleshooting task when ignition is observed, the N1 speed increases but the combustion chamber flames go out without any action by the pilot.
- <u>"T4.5 limitations exceeded"</u>: Do this troubleshooting task when a T4.5 overtemperature is observed during engine running or during starting sequence.

B. POSSIBLE CAUSES

- Start air purge valve
- VARILIP seal from the pump and metering unit
- Aircraft (boost pump)

2. PROCEDURE

- <u>NOTE</u>: 1. In case of a recent maintenance operation performed on this engine or on the aircraft starting system (starter, battery, fuse, selector, harness...), check first the sub-assembly concerned by this maintenance operation, in particular the plug and connectors.
- <u>NOTE</u>: It is possible to interchange an equipment item with another engine.
 - If the engine starts normally, both equipment items should be reinstalled in their original location in order to confirm the anomaly. If the anomaly is confirmed, then the unserviceable equipment has to be replaced.
 - If the engine does not start normally, both the equipment items should be reinstalled in their original location and you should perform the next step of the troubleshooting tree.

TASK 71-00-06-812-812-A01

ABORTED START - FLAMES AT THE EXHAUST PIPE TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

In the troubleshooting book, there are different troubleshooting tasks concerning aborted start. Titles are:

- <u>"Aborted start: gas generator not driven"</u>: Do this troubleshooting task if the gas generator is not driven at all (N1 = 0%) at the engine start selection or during cranking.
- <u>"Aborted start: no ignition"</u>: When the pilot turns the main selector STOP/IDLE/FLIGHT to IDLE or FLIGHT, the EECU launches the starting sequence. At starting, the gas generator is driven but no ignition of the combustion chamber (T4 does not increase).
- <u>"Aborted start: first start aborted"</u>: Do this preventive task when there are starting difficulties only at the first start of the day, or after the aircraft has been sitting for several hours, i.e. the engine is at ambient temperature.
- <u>"Aborted start: slow start or stagnation"</u>: Do this troubleshooting task when ignition in the combustion chamber is observed, but the N1 speed increases more slowly than usual, or the N1 speed stops increasing during start (and the pilot has to abort manually the starting sequence).
- <u>"Aborted start: flames at the exhaust pipe"</u>: Do this troubleshooting task when the starting sequence generates abnormal flames at the exhaust pipe.
- <u>"Aborted start: flame out"</u>: Do this troubleshooting task when ignition is observed, the N1 speed increases but the combustion chamber flames out without any action by the pilot.
- <u>"T4.5 limitations exceeded"</u>: Do this troubleshooting task when a T4.5 overtemperature is observed during engine running or during starting sequence.

B. POSSIBLE CAUSES

- Start injectors
- Combustion chamber drain valve

2. PROCEDURE

- <u>NOTE</u>: 1. In case of a recent maintenance operation performed on this engine or on the aircraft starting system (starter, battery, fuse, selector, harness...), check first the sub-assembly concerned by this maintenance operation, in particular the plug and connectors.
- <u>NOTE</u>: It is possible to interchange an equipment item with another engine.
 - If the engine starts normally, both equipment items should be reinstalled in their original location in order to confirm the anomaly. If the anomaly is confirmed, then the unserviceable equipment has to be replaced.
 - If the engine does not start normally, both the equipment items should be reinstalled in their original location and you should perform the next step of the troubleshooting tree.

TASK 71-00-06-813-801-A01

SURGE TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

The engine surge is an abnormal phenomenon. It is important to understand and to treat the root cause before treating the engine after surge.

B. POSSIBLE CAUSES

- Air intake
- Bleed valve

2. PROCEDURE

<u>NOTE</u>: First, the fault isolation procedure helps you to find the root cause and to repair the engine part related to that root cause. After that, the troubleshooting procedure gives the checks and repairs of the event consequences on the engine.

FUEL P OFF - NO LOW FUEL PRESSURE SIGNAL TROUBLESHOOTING

1. <u>GENERAL</u>

A. PHASE AND FAILURE DETECTION

	Indication		
Phase	Alarms VEMD	Warning indicator lights	
ENGINE SHUTDOWN		Fuel tank	

B. REMINDER OF THE NORMAL OPERATING CONDITION

At engine shutdown, the low fuel pressure signal must be on.

C. POSSIBLE CAUSES

- Low-fuel pressure switch
- Control and monitoring harness
- Aircraft

2. PROCEDURE

Effectivity: C2

TASK 71-00-06-815-805-A01

ENG P OFF - NO LOW OIL PRESSURE SIGNAL TROUBLESHOOTING

1. <u>GENERAL</u>

A. PHASE AND FAILURE DETECTION

	Indication		
Phase	Alarms VEMD	Warning indicator lights	
ENGINE SHUTDOWN		Red ENG 1 or ENG 2 off	

B. REMINDER OF THE NORMAL OPERATING CONDITION

At engine shutdown, the ENG 1 or ENG 2 Lights must be on.

C. POSSIBLE CAUSES

- Low-oil pressure switch
- Control and monitoring harness
- Aircraft

2. PROCEDURE

Effectivity: C2

The information in this manual is subject to the warning given on the information page.

TASK 71-00-06-815-806-A01

POWER TURBINE BLOCKED TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

At engine shutdown, the power turbine must turn freely.

B. POSSIBLE CAUSES

- Exhaust pipe assembly
- Labyrinth ring

2. PROCEDURE

Failures observed during engine operation71-00-06-815-806-A01Page 101Dec. 30/2019

ARRIEL 2 C2

TASK 71-00-06-816-801-A01

SMOKE FROM EXHAUST PIPE TROUBLESHOOTING

1. <u>GENERAL</u>

A. REMINDER OF THE NORMAL OPERATING CONDITION

 In normal operating condition, no white smoke at the exhaust pipe outlet and no important oil consumption.

B. POSSIBLE CAUSES

- Clogging of the rear bearing
- Breather sealing ring
- Module 03
- P3 tube of module 05
- Module 04
- Module 03 breather pipe
- Vent line
- Start electro-valve

2. PROCEDURE

<u>NOTE</u>: If the oil tank is overfilled, excess oil will be consumed via the vent line until optimum oil tank level is reached. This may cause some oil smoke at the exhaust.

TASK 71-00-06-816-803-A01 PARTICLES IN THE OIL FILTERING ELEMENT TROUBLESHOOTING

1. <u>GENERAL</u>

A. REMINDER OF THE NORMAL OPERATING CONDITION

 Findings made from the application of the removal procedure of the oil filtering element (Refer to Task 72-61-00-900-803)

<u>CAUTION</u>: ACCEPT THE PRESENCE OF SOME CUTTING CHIPS ONLY DURING THE 20 FIRST HOURS OF THE ENGINE OPERATION.

CAUTION: SEND THE PARTICLES TO A SPECIALIZED LABORATORY FOR ANALYSIS. ONLY A SPECIALIZED LABORATORY CAN MAKE AN ACCURATE DIAGNOSIS.

B. POSSIBLE CAUSES

- Damage of a rotating assembly
- Damage of a seal, etc
- Clogging of the rear bearing.

TASK 71-00-06-816-804-B01

LEAK AT THE AIRCRAFT DRAIN CLUSTER TROUBLESHOOTING

1. <u>GENERAL</u>

A. REMINDER OF THE NORMAL OPERATING CONDITION OR FAILURE DETECTION

This troubleshooting task is relevant in case of abnormal leak noticed at the helicopter drain under the engine deck.

- If there is an oil leakage, this one must meet the criteria defined on the Task 79-00-00-280-801.
- If there is a fuel leakage, this one must meet the criteria defined on the Task 73-23-00-700-801.

B. POSSIBLE CAUSES

- Magnetic seal of the transmission shaft
- Sealing ring of the fuel filtering element
- Varilip seal of the pump and metering unit assembly.
- Engine or equipment external leakage

TASK 71-00-06-816-805-A01

ABNORMAL FUEL LEAKAGE AT THE TANK RETURN **FUEL TUBE** TROUBLESHOOTING

1. **GENERAL**

Α. FAILURE DETECTION CONDITIONS

- Findings made after the application of the inspection procedure of the fuel system bleedsystem(Refer to Task 72-00-43-200-804)

POSSIBLE CAUSES Β.

- Starting air bleed valve —
- Fuel valve assembly

TASK 71-00-06-816-806-A01

FUEL FILTER CLOGGING INDICATOR POPPED OUT TROUBLESHOOTING

1. <u>GENERAL</u>

A. PHASE AND FAILURE DETECTION

- The red fuel filter mechanical blockage indicator is popped out.

B. GENERAL DESCRIPTION

The engine is equipped of:

- one fuel filter pre-blockage pressure switch connected to the aircraft.
- one red fuel filter mechanical blockage indicator.

C. POSSIBLE CAUSES

- Pre-blockage pressure switch of the fuel filtering element
- Control and indicating harness
- Blockage visual indicator of the fuel filter
- Fuel contamination

TASK 71-00-06-816-807-A01

FUEL DILUTION RATE IN OIL NOT COMPLIANT TROUBLESHOOTING

1. <u>GENERAL</u>

A. REMINDER OF THE NORMAL OPERATING CONDITION

This troubleshooting task is applicable when the result of the control of the fuel dilution in oil defined in Task 70-02-00-940-801 is not compliant.

B. POSSIBLE CAUSES

- Oil filter
- Start electrovalve

<u>NOTE</u>: A failure at the start electrovalve can come along with a smell of fuel in the cockpit and/or of smoke at the exhaust pipe.

TASK 71-00-06-816-808-A01

INCORRECT OPERATION OF ONE OF THE IGNITION DEVICE LINES TROUBLESHOOTING

1. <u>GENERAL</u>

A. FAILURE DETECTION CONDITIONS

- Finding after the application of the check and inspection procedure of the ignition system (Refer to Task 72-43-00-200-806)
- The second ignition SYSTEM is serviceable after the application of task (Refer to Task 72-43-00-200-806)

B. POSSIBLE CAUSES

- High energy ignition unit
- Ignition cable
- Igniter plug

TASK 71-00-06-816-811-A01

NON CONFORM OIL CONSUMPTION TROUBLESHOOTING

1. <u>GENERAL</u>

A. REMINDER OF THE NORMAL OPERATING CONDITION

 During operation, the oil consumption must be less than the limit defined. (Refer to Task 79-00-00-200-801).

B. POSSIBLE CAUSES

- Rear bearing (clogging of duct)
- Module 04 (bad sealing of labyrinth seal)
- Magnetic seal of the drive shaft
- Aircraft (vent pipe, hose)
- Magnetic seal of the breather
- P3 tube of the module 05 (bad sealing of M04 labyrinth seal)
- Preformed packing of the breather cover
- Oil tubes and unions.

TASK 71-00-06-816-812-A01

CHECK OF ABNORMAL OIL PRESSURE TROUBLESHOOTING

1. <u>GENERAL</u>

A. PHASE AND FAILURE DETECTION

- After a check of the oil pressure (Refer to Task 79-00-00-200-801).

B. POSSIBLE CAUSES

- Clogging of the rear bearing
- Leaks
- Oil system contamination
- Oil pump
- Reduction gearbox module (M05).

TASK 71-00-06-816-814-A01

OIL LEAKAGE BETWEEN M03 AND M04 TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

 No leakage finding after visual inspection and the engine compartment floor. Refer to chapter 05.

B. POSSIBLE CAUSES

- Wear on the preformed packing at the top of the oil inlet duct
- Defective sealing at the copper seal of the duct at the rear bearing box
- Defective sealing of the preformed packings of the oil valve assembly

TASK 71-00-06-816-819-A01

ENGINE POWER CHECK - INCORRECT MARGIN TROUBLESHOOTING

1. <u>GENERAL</u>

A. INDICATION ON THE AVIONIC

The engine power check is incorrect.

B. GENERAL DESCRIPTION

Monitoring of in-service performance is a great help for engine health assessment. Trend monitoring improves troubleshooting through interpretation of performance and degradation localization. (Refer to Task 71-02-14-940-801).

<u>CAUTION</u>: MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE ANY INTERVENTION ON THE ENGINE.

C. POSSIBLE CAUSES

- T45 conformation
- Torque conformation
- Torque sensor
- Control harness
- Pyrometric harness
- Module 02 Axial Compressor
- Module 03 Gas Generator (Centrifugal compressor and HP Turbine)
- Module 04 Power Turbine
- Air path fouling
- Air leakage
- Air intake
- P0 aircraft measuring system
- T0 aircraft measuring system

2. <u>PROCEDURE</u>

<u>NOTE</u>: If the EECU is pre TU93C, apply the correction on the VEMD results. Refer to flight manual.

TASK 71-00-06-816-821-A01

FUEL ODOR IN THE CABIN TROUBLESHOOTING

GENERAL 1.

FAILURE DETECTION CONDITIONS Α.

- Fuel odor in cabin

Β. **POSSIBLE CAUSES**

- Start electro-valve
- Module 03
- Aircraft

2. PROCEDURE

given on the information page

Failures observed during maintenance71-00-06-816-821-A01Page 102Dec. 30/2021

TASK 71-00-06-816-825-A01

OIL LEAK AT BLEED VALVE OR AIR INTAKE TROUBLESHOOTING

1. <u>GENERAL</u>

A. REMINDER OF THE NORMAL OPERATING CONDITION

 In normal operation, while the engine is running there is no oil leak at the bleed valve or the air intake.

B. POSSIBLE CAUSES

- Blockage form the oil vent system (Airframe parts)
- Module 02
- Wrong assembly of the M01 strainers

<u>CAUTION</u>: AN INVERSION OF THE STRAINERS (72-61-00-01-070) AND (72-61-00-01-100) (REFER TO TASK 72-61-00-900-806) COULD LEAD TO AN INCORRECT OIL RETURN TO THE TANK. THAT WILL GENERATE AN OIL OVERFLOW THROUGH BEARING, ALLOWING OIL TO ESCAPE TO THE BLEED VALVE OR THE AIR TAPPINGS DURING NEXT ENGINE RUN.

2. PROCEDURE

<u>NOTE</u>: Distortion or partial obstruction of the vent line can cause back pressure into the vent system that may increase oil leak from the vent line and also cause oil leak from the bleed valve or the air intake. Pay particular attention to distortion at the tip of the vent line in the exhaust pipe.

given on the information page

The information in this manual is subject to the warning

ARRIEL 2 C2

Failures observed during maintenance71-00-06-816-825-A01Page 102June 15/2023

TASK 71-00-06-816-827-A01

OIL LEAKAGE OF THE POWER DRIVE OF THE STARTER TROUBLESHOOTING

1. <u>GENERAL</u>

A. GENERAL DESCRIPTION

In the event of an oil leakage at the starter power drive, this one must meet the criteria defined on the Task 79-00-00-280-801 (Lubrication system-external leakage/ Special procedure).

B. POSSIBLE CAUSES

- Seal of the Dynastart Adapter.

2. PROCEDURE

Failures observed during maintenance 71-00-06-816-827-A01

MAINTENANCE MANUAL

Failures observed during maintenance71-00-06-816-827-A01Page 102June 15/2021

TASK 71-00-06-816-833-A01

OIL TANK LEVEL SLOWLY DECREASES AFTER ENGINE SHUTDOWN TROUBLESHOOTING

1. GENERAL

A. FAILURE DETECTION CONDITIONS

After an engine is stopped for one day or more, it is possible that the oil level does not return to normal. An internal leak of the oil pump slowly occurs by gravity due to the check valve leakage.

B. POSSIBLE CAUSES

Oil pump

2. PROCEDURE

ARRIEL 2 C2

1
REPLACE THE OIL PUMP.
(REFER TO TASK
79-24-00-900-801)
NOTE: AFTER AN ENGINE IS
STOPPED FOR ONE DAY OR
MORE, IT IS POSSIBLE THAT
THE OIL LEVEL DOES NOT
RETURN TO NORMAL. AN
INTERNAL LEAK OF THE OIL
PUMP SLOWLY OCCURS BY
GRAVITY DUE TO THE CHECK
VALVE LEAKAGE.
END OF PROCEDURE.

THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.

C. POSSIBLE CAUSES

- Junction and T4.5 conformation box
- Pyrometric harness
- EECU
- Control harness

Effectivity: C2

2. PROCEDURE

<u>NOTE</u>: This failure may happen only when the pyrometric probes are hot. In this case, it will normally not be present at EECU power on. However, if the check is done right after an engine run, when the probes are still hot, the failure may occur at EECU power on and you will be able to troubleshoot the faulty pyrometric harness on ground, as per this fault tree.

TASK 71-00-06-817-884-A01

BLEED VALVE POSITION INCONSISTENCY OR BLEED VALVE ANOMALY OBSERVED TROUBLESHOOTING

1. GENERAL

A. VEMD FAILURE MESSAGE

	VEMD MESSAGE
	BV. A or BV. B
CAUTION:	MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE YOU SWAP THE ENGINE ELECTRONIC CONTROL UNITS.
CAUTION:	WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.
<u>CAUTION</u> :	THE FAILURE INFORMATION ON THE VEMD SYSTEM STATUS PAGE MAY NO LONGER BE AVAILABLE AFTER BATTERY POWER IS TURNED OFF. THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.
B. GENE	RAL DESCRIPTION
The ble the blee signal c	eed valve opening and closing are not controlled by the EECU. The P3/P0 ratio controls ed valve opening and closing. A position detector (microswitch) sends the position of the bleed valve to the EECU.
During close th become	the starting phase, the bleed valve is open until a sufficient P3/P0 ratio is obtained to ne bleed valve. During the rundown phase, the bleed valve is closed until P0/P3 ratio es sufficiently low to open the bleed valve.
The fail EECU i	lure message "BV.A and/or BV.B" is displayed when the position data received by the is inconsistent with the bleed valve position calculated by the EECU.
This tro display	oubleshooting task can be applied when either the failure message "BV.A or BV.B" is ed or a bleed valve anomaly is observed.
There is availab	s a risk of surge if the bleed valve is stuck closed or the maximum power is not le if the bleed valve is stuck open.
C. POSS	IBLE CAUSES
– Ble – Ble – P3 – EE – Cor	ed valve ed valve filter air tube CU ntrol harness

Effectivity: C2

71-00-06-817-884-A01

- Microswitch (position detector) of the bleed valve

2. PROCEDURE

<u>NOTE</u>: If the failure is recorded by both EECU channels A and B, the failure is likely to be external to the EECU. If the failure is seen only by channel A or channel B, the failure is likely to be internal to the EECU.

TASK 71-00-06-817-889-A01

HELICOPTER T4.5 FAILURE TROUBLESHOOTING

1. <u>GENERAL</u>

A. VEMD FAILURE MESSAGE

VEMD MESSAGE
H TOT. A

The helicopter T4.5 is sent to the EECU through the ARINC link label 132.

This message shows that the EECU operates correctly: an incorrect communication between the aircraft and the EECU can cause a "H. LINK A" or ARINC failure message.

B. FAILURE EFFECTS

EFFECTS	CAD MESSAGE
Impossible to use the helicopter T45 as backup val-	flashing GOV
ue. No effect on the engine operation.	

CAUTION: MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE YOU SWAP THE ENGINE ELECTRONIC CONTROL UNITS.

- CAUTION: WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.
- <u>CAUTION</u>: THE FAILURE INFORMATION ON THE VEMD SYSTEM STATUS PAGE MAY NO LONGER BE AVAILABLE AFTER BATTERY POWER IS TURNED OFF. THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.

C. POSSIBLE CAUSES

- Junction and T4.5 conformation box
- Pyrometric harness
- Control and monitoring harness
- Aircraft wiring from P100 to T4.5 indication (Aircraft system)

CROSS TALK ARINC TROUBLESHOOTING

1. <u>GENERAL</u>

A. VEMD FAILURE MESSAGE

VEMD MESSAGE
BALANC. A

B. FAILURE EFFECTS

EFFECTS	CAD MESSAGE
N2 regulation in proportional mode (loss of NR revolution).	GOV
Both EECUs display simultaneously the failure message.	
Accuracy of N2 is degraded.	

- <u>NOTE</u>: This failure is reversible if the engine is in OFF, START or IDLE mode (meaning that if the fault condition disappears, the fault message and effect will also disappear). In FLIGHT mode, the failure is not reversible.
- <u>CAUTION</u>: MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE YOU SWAP THE ENGINE ELECTRONIC CONTROL UNITS.
- <u>CAUTION</u>: WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.
- <u>CAUTION:</u> THE FAILURE INFORMATION ON THE VEMD SYSTEM STATUS PAGE MAY NO LONGER BE AVAILABLE AFTER BATTERY POWER IS TURNED OFF. THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.

C. POSSIBLE CAUSES

- EECU
- EECU cross link function (Aircraft system)

2. PROCEDURE

- <u>NOTE</u>: Cross-talk connection from connector P2 EECU 1 to connector P2 EECU 2: ARINC transmission:
 - Pin 6 EECU 1 connects to pin 8 EECU 2
 - Pin 2 EECU 1 connects to pin 9 EECU 2.
 - ARINC reception:

DECU CONFIGURATION/AIRCRAFT CONFIGURATION INCONSISTENCY TROUBLESHOOTING

1. GENERAL

A. VEMD FAILURE MESSAGE

VEMD MESSAGE
VERSION. A or VERSION. B

B. FAILURE EFFECTS

EFFECTS	CAD MESSAGE
If VERSION. A only or if VERSION. A + VERSION. B	
 The helicopter configuration received via the ARINC message is not recognized by the EECU. Display of degraded operation. 	GOV
If VERSION. B only	
 No effect. 	flashing GOV

CAUTION: WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.

<u>CAUTION:</u> THE FAILURE INFORMATION ON THE VEMD SYSTEM STATUS PAGE MAY NO LONGER BE AVAILABLE AFTER BATTERY POWER IS TURNED OFF. THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.

C. POSSIBLE CAUSES

– EECU

This failure message means that the incorrect EECU is installed on the airframe.

HELICOPTER P0 FAILURE TROUBLESHOOTING

1. <u>GENERAL</u>

I

A. VEMD FAILURE MESSAGE

VEMD MESSAGE	
H PO. A	

B. FAILURE EFFECTS

EFFECTS	CAD MESSAGE
 If engine P0 is available: use of this value as backup. No effect except accuracy of the P0 used 	flashing GOV
 If engine P0 not available: use of a backup value. No more P0 effect on N2 datum. 	GOV

The helicopter P0 is sent to the EECU through the ARINC link label 215.

This message shows that the EECU operates correctly: an incorrect communication between the aircraft and the EECU can cause a "H. LINK A" or ARINC failure message.

<u>CAUTION</u>: MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE YOU SWAP THE ENGINE ELECTRONIC CONTROL UNITS.

- <u>CAUTION</u>: WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.

NO HELICOPTER ARINC MESSAGE TROUBLESHOOTING

1. <u>GENERAL</u>

A. VEMD FAILURE MESSAGE

VEMD MESSAGE
H LINK. A

B. FAILURE EFFECTS

EFFECTS	CAD MESSAGE
Same effect as "Helicopter P0 failure" and "Helicopter T4.5 failure". Impossible to	GOV
perform engine health check.	

- <u>NOTE</u>: On ground, with engine switch in OFF position, when the VEMD is in the MAINTENANCE MODE, the VEMD stops sending the ARINC message to the EECU. In consequence, the EECU declares a HELICOPTER ARINC failure and the GOV light illuminates. This condition is reversible and the failure condition and GOV light will disappear as soon as the VEMD returns to the NORMAL mode.
- **CAUTION:** MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE YOU SWAP THE ENGINE ELECTRONIC CONTROL UNITS.
- <u>CAUTION</u>: WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.
- <u>CAUTION</u>: THE FAILURE INFORMATION ON THE VEMD SYSTEM STATUS PAGE MAY NO LONGER BE AVAILABLE AFTER BATTERY POWER IS TURNED OFF. THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.

C. POSSIBLE CAUSES

- EECU
- Helicopter ARINC message function (Aircraft system)
- Electrical harness

2. PROCEDURE

<u>NOTE</u>: The EECU receives the helicopter ARINC signal at connector P2, pin 7 (high) and pin 3 (low).

EL.V. A or EL.V. B	

B. FAILURE EFFECTS

EFFECTS	CAD MESSAGE
At engine shutdown, the engine will not shut down immediately.	GOV
After a few seconds, engine shutdown by stepper motor closing.	
Loss of overspeed protection function.	

<u>CAUTION</u>: MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE YOU SWAP THE ENGINE ELECTRONIC CONTROL UNITS.

<u>CAUTION</u>: WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.

<u>CAUTION</u>: THE FAILURE INFORMATION ON THE VEMD SYSTEM STATUS PAGE MAY NO LONGER BE AVAILABLE AFTER BATTERY POWER IS TURNED OFF. THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.

C. POSSIBLE CAUSES

- EECU
- Stop electro-valve
- Control and monitoring harness
- Stop electro-valve control function (Aircraft system)

2. PROCEDURE

<u>NOTE</u>: In normal operation, with the off/idle/flight switch on "off" position and battery power on, there should be a 28V power supply power to the "stop" solenoid of the stop electrovalve, at connector E.C. MA-AT/ON-OFF E.V. – P010, between pin 4 (+) and pin 2 (-).

At the aircraft interface, at plug J100 (interfacing with connector P100), with the off/ idle/flight switch on "off" position there should be a 28 V power supply between pins 39 (+) and 8 (-).

TASK 71-00-06-817-955-A01

OVERSPEED PROTECTION FAILURE TROUBLESHOOTING

1. <u>GENERAL</u>

A. VEMD FAILURE MESSAGE

VEMD MESSAGE				
OV/SP. A				

B. FAILURE EFFECTS

EFFECTS	CAD MESSAGE
The overspeed protection is no longer available.	flashing GOV

- <u>CAUTION:</u> DO NOT SWAP THE ENGINE INTERFACE BOX (AIRCRAFT MANUFACTURER RESPONSIBILITY) BETWEEN THE ENGINES FOR TROUBLESHOOTING. THIS MAY CAUSE ADDITIONAL DAMAGE TO THE ELECTRICAL CIRCUIT. INSTEAD, TEST THE COMPONENTS AS DESCRIBED IN THE PROCEDURE.
- CAUTION: MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE YOU SWAP THE ENGINE ELECTRONIC CONTROL UNITS.
- <u>CAUTION</u>: WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.
- <u>CAUTION</u>: THE FAILURE INFORMATION ON THE VEMD SYSTEM STATUS PAGE MAY NO LONGER BE AVAILABLE AFTER BATTERY POWER IS TURNED OFF. THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.

C. POSSIBLE CAUSES

- Stop electro-valve
- N2 speed sensors
- Control harness
- Control and monitoring harness
- EECU
- EECU to control and monitoring harness wiring (Aircraft system).

2. PROCEDURE

- <u>NOTE</u>: For the EECU to operate the stop electro-valve in case of overspeed, there must be continuity between:
 - Connector P4 pin 64 and connector P010 pin 4

Effectivity: C2

71-00-06-817-955-A01

– Connector P4 pin 65 and connector P010 pin 2. Make sure to check both ways as there as some diodes in the wiring.

- **<u>NOTE</u>**: Control harness wires used for the overspeed functions:
 - Wire from P203 pin 41 to P201 pin 6
 - Wire from P203 pin 47 to P201 pin 7.
- **<u>NOTE</u>**: There should be continuity between:
 - Connector P4 pin 64 (+) and plug J100 pin 39 (+)
 Connector P4 pin 65 (-) and plug J100 pin 8 (-).
 Make sure to check both ways as there as some diodes in the wiring.
 Plug J100 interfaces with control and monitoring harness connector P100.
- <u>NOTE</u>: Replace only the stop electro-valve, not the complete adjusted valve assembly. The rest of the adjusted valve assembly cannot cause the OV/SP. A failure.
- <u>NOTE</u>: Experience shows that if the stop electro-valve has internal corrosion, it may pass the electrical test as per box 7 but is still the source of the OV/SP. A failure. If you suspect exposure to water or moisture, replace the stop electro-valve. Continue at box 15 only if the failure message is still present after stop electro-valve replacement.

HMU OUT OF NEUTRAL POSITION TROUBLESHOOTING

1. <u>GENERAL</u>

A. VEMD FAILURE MESSAGE

VEMD MESSAGE
"OUT NEUTRL" and "DEGRADE" on "MSG" line
no failure displayed on "FAIL" line

B. FAILURE EFFECTS

EFFECTS	CAD MESSAGE
At Power ON	
Start impossible.	GOV
ENGINE RUNNING	
The HMU is out of neutral while the EECU is in con- trol. In normal operation, the HMU is out of neutral position only when the manual mode (EBCAU) is se- lected.	GOV
Degraded operation, with slower engine acceleration and deceleration.	

CAUTION: MAKE SURE THAT THE CONCERNED AIRCRAFT SYSTEM IS SERVICEABLE BEFORE YOU SWAP THE ENGINE ELECTRONIC CONTROL UNITS.

- <u>CAUTION</u>: WHEN CHECKING THE "FAIL" LINE ON THE VEMD SYSTEM STATUS PAGE, MAKE SURE TO CHECK ALL FAILURES. TO DO SO, PRESS THE SELECT KEY UNTIL A WHITE FRAME SURROUNDS THE "FAIL" LINE. THEN, USE "+/-" KEY TO VIEW ALL FAILURES. PROCEED THE SAME WAY TO CHECK ALL MESSAGES ON THE "MSG" LINE.
- <u>CAUTION</u>: THE FAILURE INFORMATION ON THE VEMD SYSTEM STATUS PAGE MAY NO LONGER BE AVAILABLE AFTER BATTERY POWER IS TURNED OFF. THEREFORE, AFTER A FAILURE OCCURRED, IT IS VERY IMPORTANT TO CHECK AND WRITE DOWN ALL INFORMATION FROM THE "FAIL" LINE AND THE "MSG" LINE BEFORE TURNING BATTERY POWER OFF.

C. POSSIBLE CAUSES

- HMU
- EECU
- Control harness
- EBCAU function (Aircraft system)

Effectivity: C2

<u>NOTE</u>: This message also indicates potential malfunction of the EBCAU system, which is part of the aircraft supply. Make sure that the related aircraft system is serviceable before replacing engine accessories.
